Contrast plugin for Figma
Check the contrast ratios of colors as you work.

Stark - Contrast & Accessibility Checker
An all-in-one accessibility plugin for Figma that scans, simulates, suggests, and annotates your designs.

WebAIM: Contrast Checker
Test the contrast of foreground and background colors.

Color contrast

Color contrast is essential for making content accessible to users with visual impairments. We adhere to [WCAG AA standards](#) for color contrast across all our interfaces. This ensures that our designs are accessible to everyone.

To determine the required level of color contrast for a component, first identify its type:

- Decorative and disabled elements:** No specific color contrast requirement.
- Information-bearing elements:** Must have adequate contrast between the foreground (text or graphics) and the background.

Element	Min contrast ratio	Notes
Standard text	4.5:1	
Large text	3:1	At least 18-point regular or 14-point bold, or equivalent size for CJK fonts.
UI components and controls	3:1	Must have enough contrast to identify and operate, including non-text indicators like checkboxes and dropdown arrows.
Graphical objects	3:1	Parts of graphics required to understand the content must meet contrast guidelines.
Decorative and disabled elements	None	

Some key points to keep in mind:

- When placing text over backgrounds that may change (like gradients or images), ensure the text color maintains the required contrast ratio throughout.

- Elements that aren't text but are crucial for interaction, such as buttons and interactive icons, must be easily distinguishable from their background, adhering to the 3:1 contrast ratio.
- Check the contrast of your colors as you are designing, not once you're all done. Manually reviewing colors can help train your eye to quickly identify which color combinations are accessible.
- Don't aim for the minimums, aim to exceed them!

Color blindness

Ensuring accessibility in design is crucial, especially for individuals with color blindness. Do not rely solely on color to convey information, indicate actions, prompt responses, or distinguish elements. Use text labels, patterns, or icons alongside color (e.g., for error states, charts, or status indicators).

Using color-blindness simulators can help designers understand how their designs appear to individuals with color blindness. For those using Figma, the [Contrast](#) and [Stark](#) plugins are excellent resources for both checking contrast and simulating color blindness.

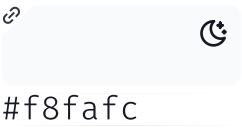

Surface colors accessibility

The accessibility scores of the surface colors behind the `text-primary` and `text-inverse` colors are displayed below. For other combinations, always check the accessibility score to ensure sufficient contrast.

The `text-primary` color token is used for most text elements in both Light and Dark modes. When the background is too dark in Light mode or too light in Dark mode, use `text-inverse` to maintain readability.

Text Primary

Text Inverse

Semantic color	☀ Light	🌙 Dark
Page Background	AAA	AAA
Surface Primary Neutral Lite	AAA	AAA
Surface Secondary Neutral Lite	AAA	AAA
Surface Tertiary Neutral Lite	AAA	AAA
