

Blurs

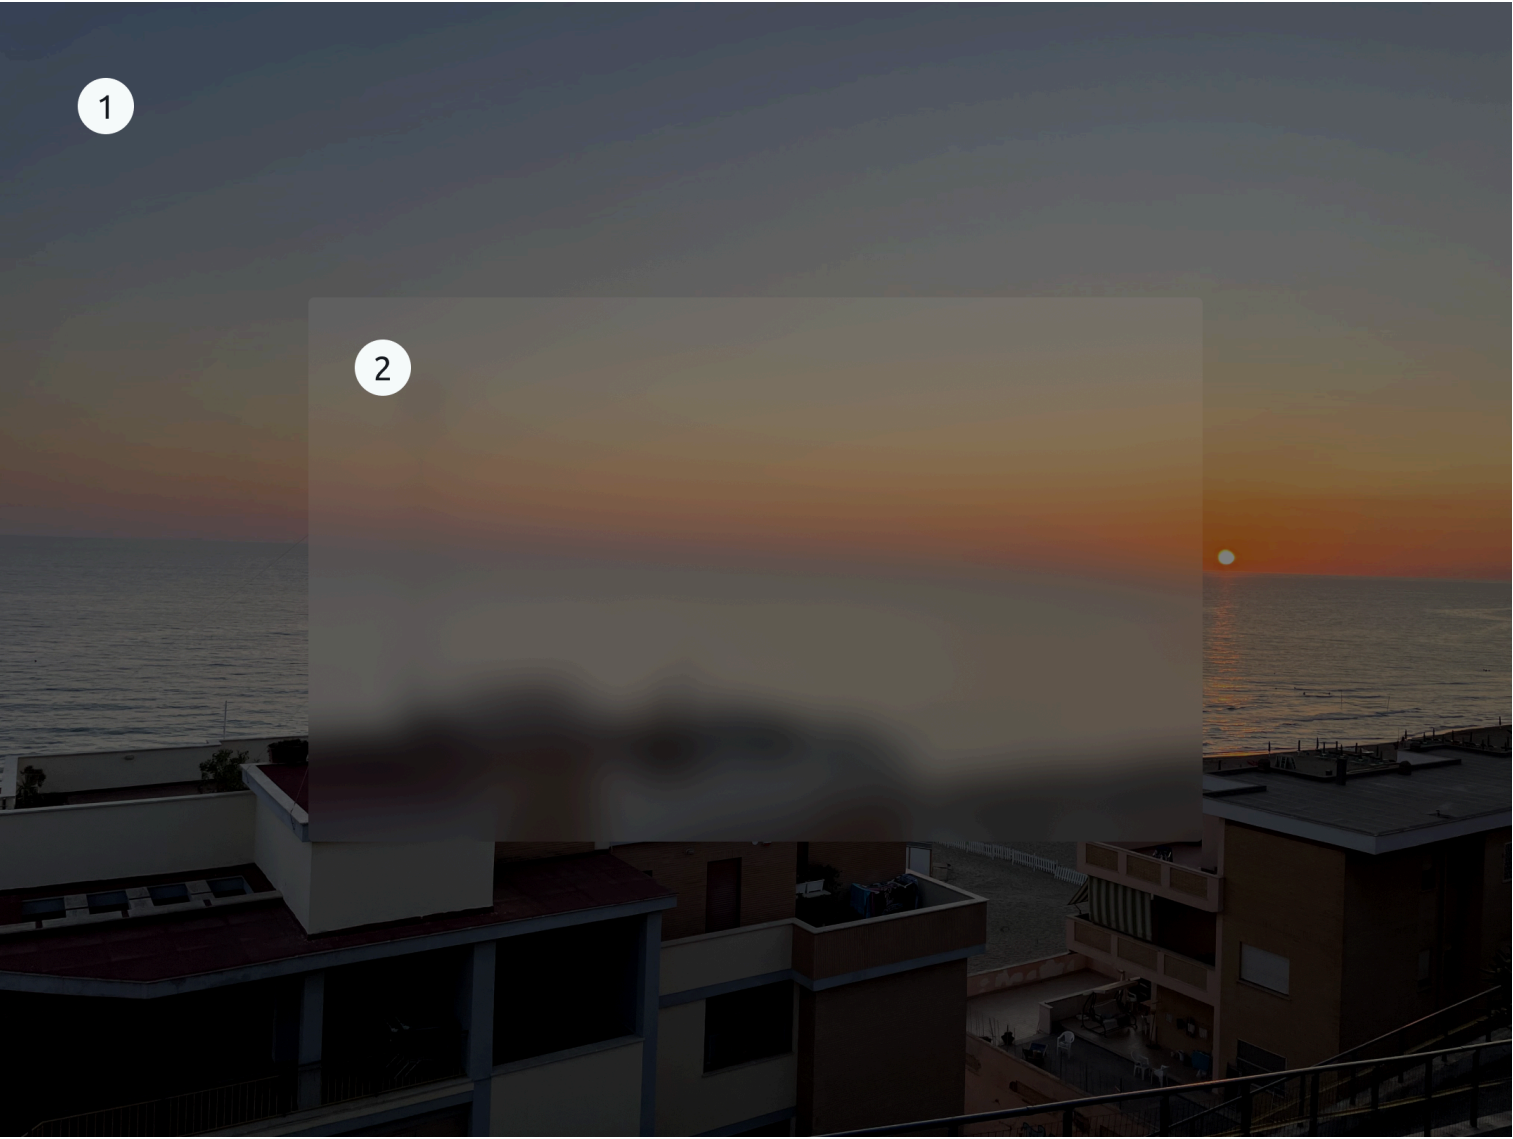

Soften backgrounds and draw focus to content.

Blur is used to create focus, hierarchy, and visual clarity by de-emphasizing background elements. It helps guide user attention, improve readability, and separate content layers without cluttering the interface.

Blurring is especially useful on photographic backgrounds when typography is added on top of the image.

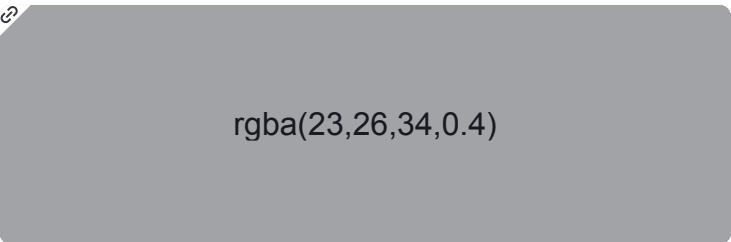

Style

To maintain design consistency, we provide a single background blur option for use.

- 1. Photographic background must have a the `page-overly` fill applied.
- 2. `background-blur` effect and `blur-color` is applied to the container's fill.

Color and effect

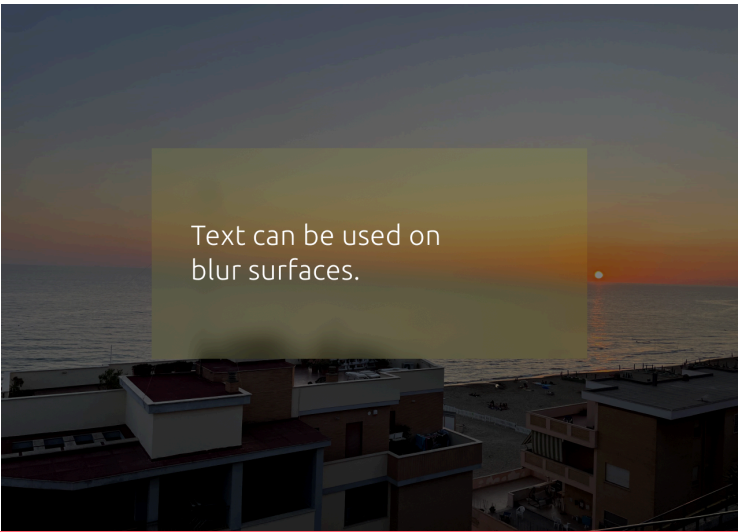

`rgba(255,255,255,0.05)`
