

Divider

Separate, define boundaries, and organize.

Component checklist

Figma component	 Open in Figma
Status	Healthy

Dividers help separate content, define boundaries, and improve readability. Use them to organize elements within layouts, such as grouping sections, actions, or items in tables and listings. Divider lines should be visually subtle and not draw attention. They support structure without overwhelming the interface.

Variants

Dividers come in two thicknesses: **thin** and **thick**.

	Thin 0.5px
	Thick 1px

Each thickness has a **primary** and **secondary** variant, distinguished by color. The primary variant is more subtle and preferred for most use cases. The secondary variant uses a slightly darker color and appears more prominent, supporting stronger visual separation when needed.

	Primary  border - secondary
	Secondary  border - primary

Usage

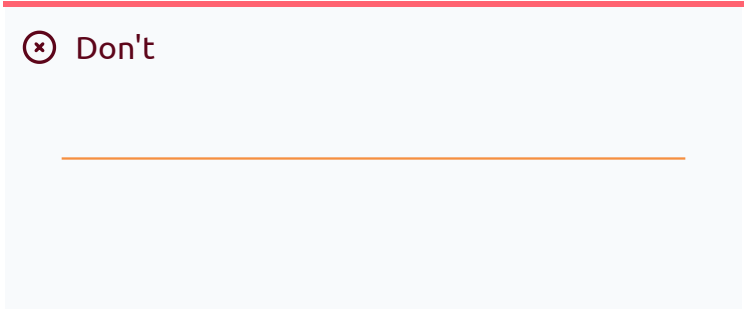

Use dividers to group related content, separate sections and improve visual structure. They are especially helpful in layouts such as tables and listings, where clear separation enhances readability and user understanding.

A filter component with dividers separating distinct categories.

Do not change the thickness of the divider.

Do not change the predefined colors of the divider.
