

Switch

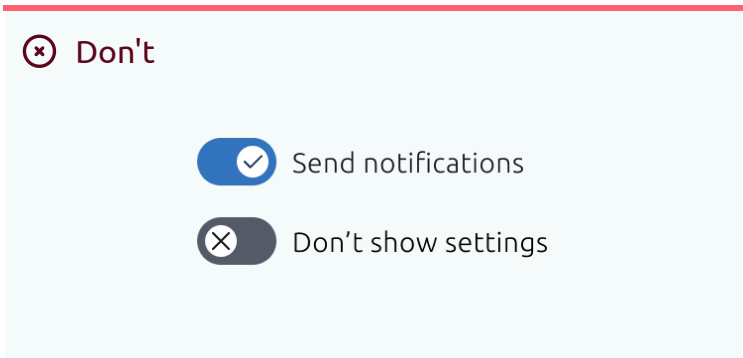

Offers a binary choice.

Content

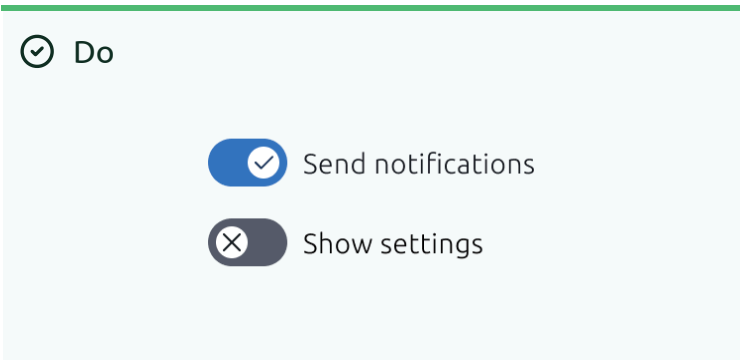

- Use positive labels like “Show settings” instead of negative or ambiguous wording such as “Don’t show settings” or “Settings off”.
- The label should indicate what happens when the switch is turned on, not its current state.
- Ensure the label clearly communicates the feature or setting being controlled.

Don't mix longer and short phrasing.

Don't use negative phrasing.

Use short and even phrasing.

Interaction

Switches must support both mouse and keyboard input to ensure accessibility and consistent behavior across devices.

Mouse

- Users can activate a switch by clicking either the switch itself or its label.
- Both the switch and label should respond to pointer events. When hovering over this region, the cursor must change to a pointer to indicate that the element is clickable.

Keyboard

- Users should be able to navigate to the switch using the

Tab

 key. Once focused, the switch can be toggled using the Spacebar.
- The focus state appears when the switch is selected via keyboard, confirming its active state and supporting accessibility standards.

Usage

✔ Use a switch when:

- The option has two mutually exclusive states.
- The change applies immediately without

Overview Specs Guidelines

- The setting remains active until the user changes it again.

✖ Don't use a switch when:

- The action requires confirmation (use a [button](#) instead).
- The state is temporary or part of a one-time action (use a [button](#) instead).
