

Tabs

Organize content into sections within the same view.

Overview Specs Guidelines

Usage

Use tabs when content is related but too large to fit in a single view. Use tabs when there are 2–7 sections; too many tabs can overwhelm users.

Use tabs when:

- There are fewer than 7 categories, and each category is distinct and mutually exclusive.
- The categorization is simple and intuitive.
- The content within each tab is relatively small, and doesn't require further filtering.

Don't use tabs when:

- Don't make nested tabs. If multiple levels of navigation are needed, consider combining tabs with other components like accordions.
- Avoid tabs for navigation between unrelated sections or pages.

For more precise, dynamic filtering of large content sets by attributes like size, type, date, and relevance, we recommend using Filters instead of tabs.

Content

Clearly label tabs to reflect their content and purpose. Keep tab labels short, consistent and descriptive.

☑ Do	☒ Don't
How to apply After applying	Applying Good to know

Use clear, consistent labels.

Don't use inconsistent labels.

Accessibility

- Use semantic HTML:
 - Wrap tabs in a container with `role="tablist"`.
 - Each tab should have `role="tab"` and be associated with a `tabpanel` via `aria-controls`.
- Support keyboard navigation:
 - **Arrow keys** to move between tabs.
 - **Enter** or **Space** to activate a tab.
- Announce tab changes to screen readers using `aria-selected` and `aria-live` attributes.
