A button initiates an action or event when clicked. This can include submitting a form, navigating to a different page, downloading a file, or opening a pop-up window.

Anatomy

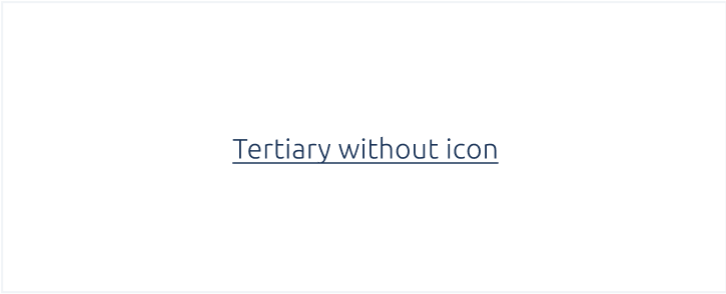

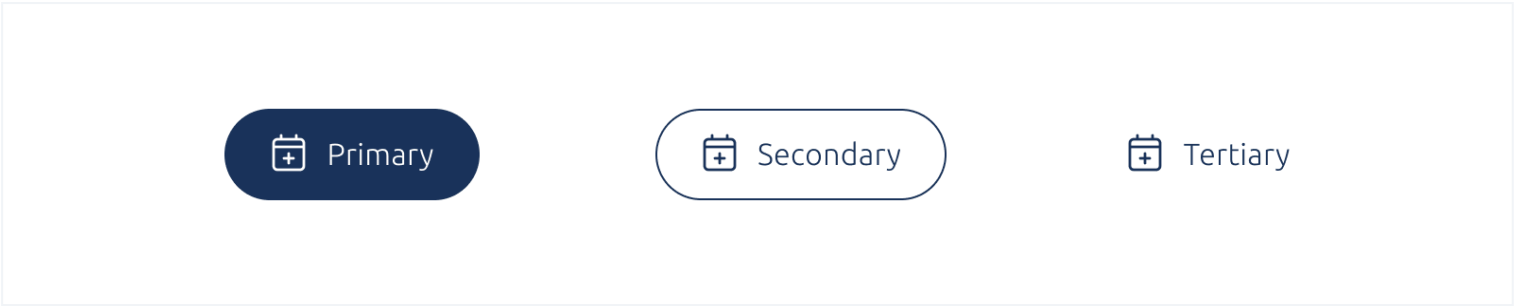

The button exists with and without an icon.

1. **Container:** Houses the content and helps represent the hierarchy and state of the button.
2. **Label:** Informs what action the button does.
3. **Icon (optional):** Can be on the left or right side and supports the label with information.

Variants

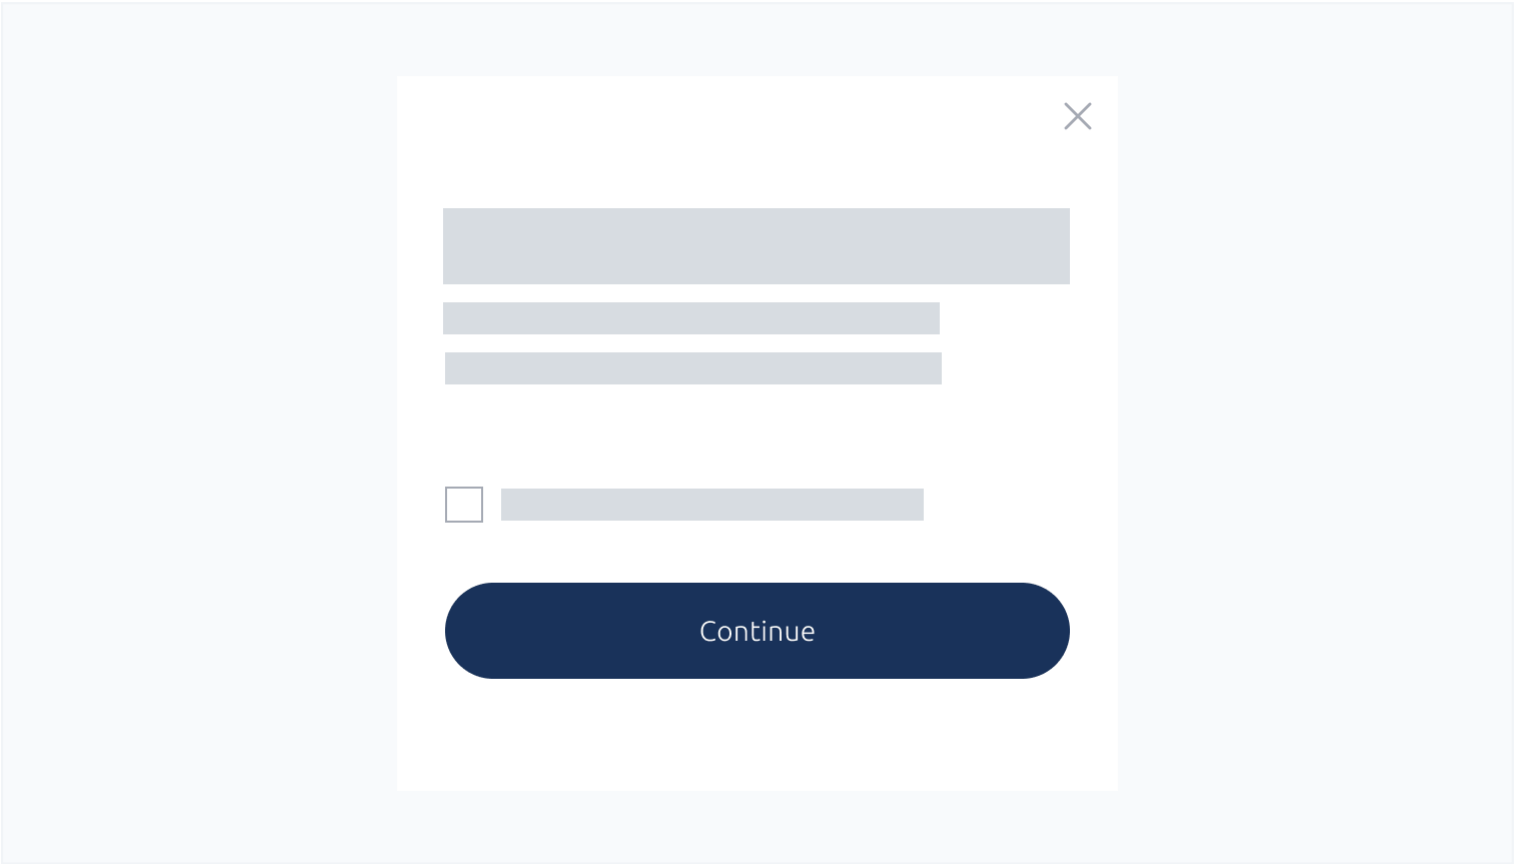

Buttons have three variants: primary, secondary and tertiary. To guide users to the main action, use a clear [button hierarchy](#). Each page should ideally have one primary button, and can include multiple secondary and tertiary buttons. This distinction helps users prioritize actions.

The tertiary variant without an icon has an underline to ensure the button meets accessibility standards.

Full-width button

Full-width buttons span the entire width of their container. These buttons offer high visibility and are easy to interact with, making them ideal for mobile layouts and fixed-width panels. Its label and icon may change upon interaction, but the button’s width should always remain constant.
