Figma component	 Open in Figma
Status	Healthy

Also known as: *Toggle*.

A switch is used when a binary choice between two mutually exclusive states is given.

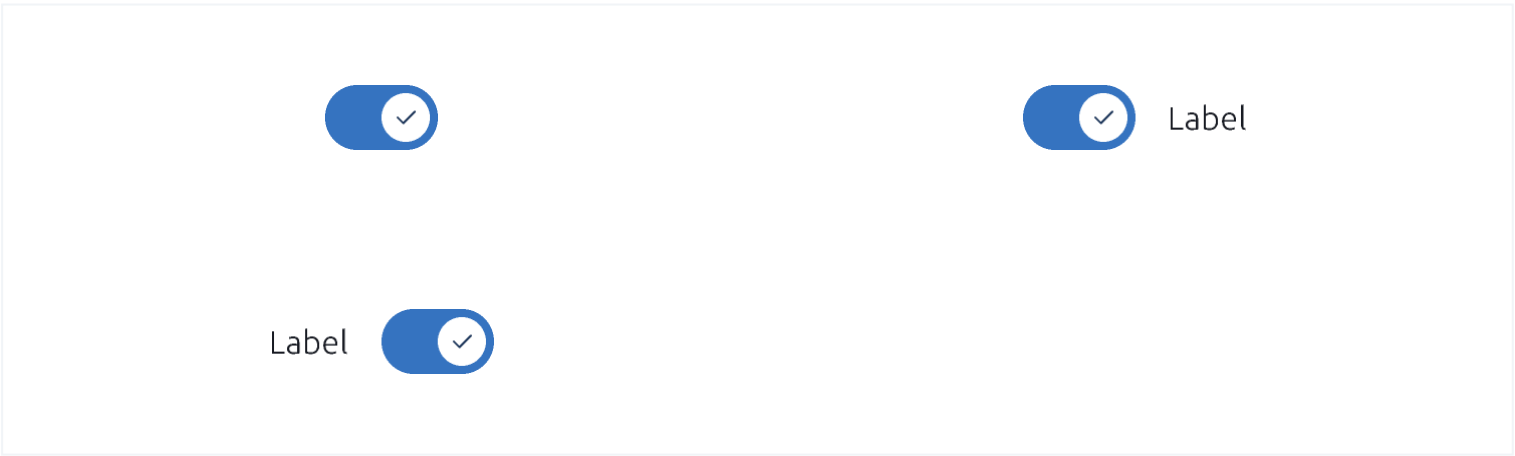

Anatomy

- 1. **Container:** Shows the state of the switch through color.
- 2. **Sliding button:** Indicates the current state (on or off) with an icon and moves horizontally when toggled.
- 3. **Label** (optional): Describes the setting controlled by the switch.

Variants

The switch comes in three variants: without a label, right-side label and left-side label.

Switches with hidden labels should only be used in contexts that make it clear what the user is selecting. It should be visually tied to a recognizable element, such as selecting a theme preview or picking a color swatch.

Always ensure accessible labeling is provided using `aria-label` or `aria-labelledby` to support screen readers.

Behavior

A switch is a toggle control that changes a setting between two states: on and off. When the switch is turned on, the associated feature becomes active; when turned off, the feature is disabled. The sliding button moves horizontally when clicked and changes its icon to indicate the current state.
