Status

Healthy

Tabs are used to organize related content into categories or sections within the same view. Users can navigate quickly between related content without changing pages.

Anatomy

1. **Label:** Displays the name of the section or view the tab represents.
2. **Indicator line:** Horizontal line beneath the label that visually communicates the state of the tab.

Behavior

The tab system allows only one tab to be active at a time. Clicking a tab activates it, displays its associated content, and hides the content of all other tabs. Tabs retain their state unless explicitly reset or refreshed, and the active tab is visually distinguished using heavier text font and a blue underline. When the tab amount exceeds the width of current viewport, side scrolling will appear.

Africa content

Side scrolling

On mobile, when the width of the tab group exceeds the screen width, side scrolling the tabs becomes possible. A chevron appears to visually indicate the direction that can be scrolled.

Tapping the chevrons scrolls the tabs horizontally.

Dragging the tabs also scrolls the content horizontally.
