

Typography

Communicate clearly with a unified typographic voice.

[Overview](#)

[Size](#)

[Color](#)

[Usage](#)

To ensure an optimal reading experience, we've carefully crafted the typography based on established UX principles. This includes high contrast between text and background, comfortably narrow column widths and line spacing to support effortless readability.

Typeface

Our brand typeface is Ubuntu. It combines a friendly and technical feel, reflecting our commitment to the positive impact of technology on humanity.

Tokens and text styles

An example of all the tokens that together create a single heading token.

Weight

Our typography comes in two weights:

- **Ubuntu Light (300)** is the primary type style, used for body text and large headlines to create an open and elegant look.
- **Ubuntu Regular (400)** adds emphasis and is applied to smaller headlines. Helps establish a strong typographic hierarchy and visual order.

In addition, the Regular style also has an Italic variant:

- **Ubuntu Regular Italic (400)** is used for decorative purposes only. It's not intended to be used for regular headings or to highlight text in paragraphs.

Text width and readability

To support a comfortable reading rhythm on desktop, we follow the general guideline of limiting line length to **80–90 characters**.

Depending on the breakpoint, text width is either fixed or fluid between two values to maintain optimal readability.

Implementation

Typography width and layout behavior are implemented through the [Text block](#) component. The component provides all available text layouts — one column (centered), one column (left-aligned), and two columns — and applies the correct text-width constraints for each option automatically.

See the Text Block’s [Layout](#) and [Text widths](#) sections for layout options and the exact width values per breakpoint.
