

Menu button

Compactly open a navigation menu.

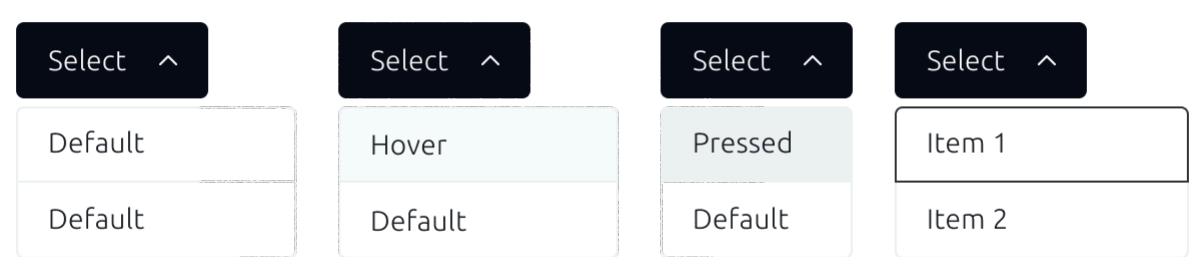

States

Each menu button variant has five states.

1. **Default:** The button’s normal state when there is no user interaction.
2. **Hover:** This state appears when a user moves their cursor over the button, providing a visual cue that the button is interactive.
3. **Pressed:** Activates when the menu button is pressed or tapped, and displays the mini menu.
4. **Focus:** Appears when the button is selected via keyboard navigation (e.g. using the **Tab** key), indicating it is ready for interaction.
5. **Disabled:** Indicates that the button is inactive and cannot be interacted with. Disabled buttons typically appear dimmed and do not respond to hover, focus, or press events.

Mini menu items support four states: default, hover, pressed, and focus.

Size

The menu button adjusts its size based on the whether the viewport is mobile or desktop. If the button text exceeds the maximum width (accounting for padding), it will be truncated and displayed with an ellipsis.

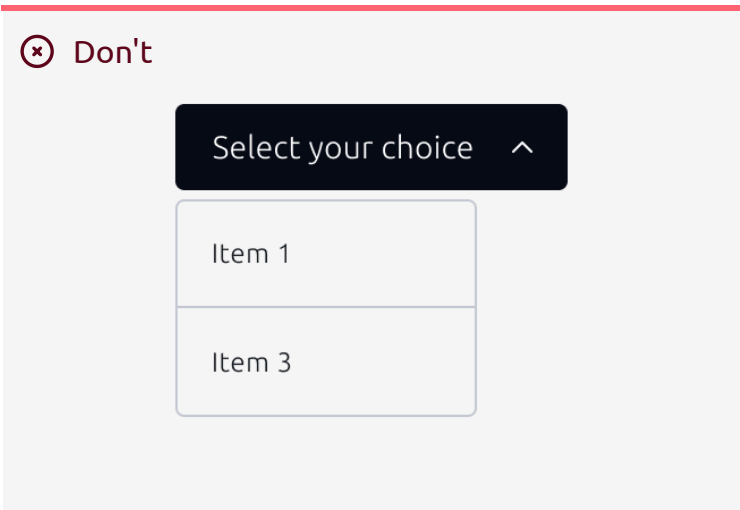

Size	Height	Target height	Max width
Small	38px	38px	312px
Medium	48px	48px	312px

Mini menu

The mini menu also has size constraints that vary by viewport. It supports a limited number of menu items to maintain visual clarity. Like the menu button, if a menu item’s text exceeds the available width, it is truncated and displayed with an ellipsis.

Size	Min width	Max width	# of menu items
Mobile	120px	312px	2-5
Desktop	140px	312px	2-5

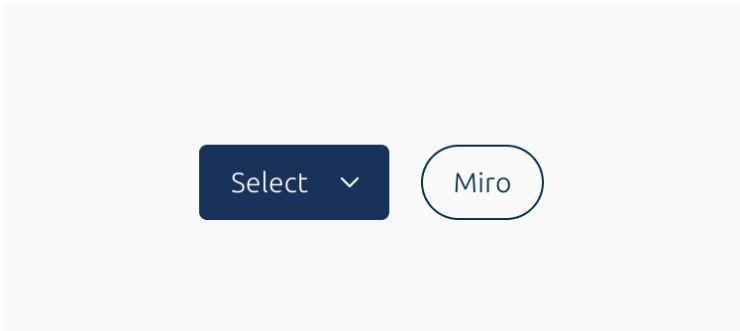

Don't make the mini menu narrower than the menu button.

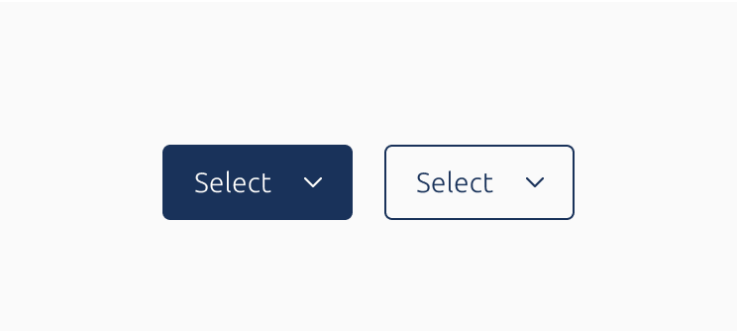

Placement

Menu buttons should not be displayed next to each other to reduce cognitive load. A menu button should also not be placed next to a regular button for the same reason.

Don't place the menu button next to a regular button.

Don't place two menu buttons next to each other.
